Abstract

The need to perform a useful Process Hazard Analysis (PHA’s) has been mandated by OSHA’s CFR Title 29 §1910.119 and EPA’s CFR Title 40 Part 68. The levels of information necessary to the PHA’s can only be anticipated to increase. Companies are now strained to accomplish quality PHA’s on minimum resources while preserving the level of analysis. This undertaking would on first appearance seem a contradiction. However, the proper application of training, technology and information management, can achieve your PHA objectives. This presentation will show these principles were applied to achieve a prompt and appropriate PHA.
